## Master Thesis

Title *Data Stream-Based Anomaly Detection for Smart Meters in Smart Grid*

Supervisor Dr. Mohammad Hossein Yaghmaee Moghaddam

Advisor Dr. Mohsen Asadi

Description One aspect of using IoT devices like smart meters is detecting anomalies in advanced metering infrastructure. This work presents an anomaly detection framework for handling real-time large-scale smart grid data (based on the Spark data processing engine) to address new emerging threats like illegal cryptocurrency mining and electricity theft. It uses a hybrid approach, combining the information inferred by analyzing the reported data from distribution transformer meters with machine learning algorithms (decision tree, random forest, and gradient boosting methods) to discover fraudulent activity. The framework also allows for a trade-off between the detection rate and triggered false alarms in the decision-making process.
