Master Thesis

Title *Data Stream-Based Anomaly Detection for Smart Meters in Smart Grid*

Supervisor Dr. Mohammad Hossein Yaghmaee Moghaddam
 Advisor Dr. Mohsen Asadi

Description One aspect of using IoT in smart homes is measuring the power consumption of the devices (using smart meters) and recognizing their usage patterns. Smart meters data could help decision-makers for power consumption management, and due to the large volume of data, big data and data mining methods should be used for their analysis. Decision making and anomaly detection based on received data Increase the need of online processing. In this project, the anomaly detection process is performed distributed and online based on the Spark data processing system. The main phases of this work are identifying the suspicious area, feature extraction, clustering users' data, and categorizing their consumption for each cluster. Related methods to the examination of power consumption network, statistical features, and machine learning algorithms have been used in this project, and the system performance has been evaluated with different measures.
